

Editorial

The current issue of ORiON comprises of four excellent and diverse papers:

- “Assessing the performance of machine learning models for default prediction under missing data and class imbalance: A simulation study” by Dube and Verster.
- “Static hedging of vanilla and exotic options in a South African context” by Levendis and Maré.
- “The profitability of flat-price broadband with an over-the-top subscription content product – benefits from cooperation” by Potgieter and Howell.
- “An optimisation approach towards soccer Fantasy Premiere League team selection” by Venter and Van Vuuren.

My thanks go to the authors for high quality papers and to Dr Elzanie Bothma and Mrs Jeanne Marié Coetzee for their assistance. I also thank ORSSA for their continued support of ORiON.
